Assignment 4: Data Wrangling (Fall 2024)

Kamil Burak Karayel

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on Data Wrangling

Directions

- 1. Rename this file <FirstLast>_A04_DataWrangling.Rmd (replacing <FirstLast> with your first and last name).
- 2. Change "Student Name" on line 3 (above) with your name.
- 3. Work through the steps, **creating code and output** that fulfill each instruction.
- 4. Be sure to **answer the questions** in this assignment document.
- 5. When you have completed the assignment, **Knit** the text and code into a single PDF file.
- 6. Ensure that code in code chunks does not extend off the page in the PDF.

Set up your session

- 1a. Load the tidyverse, lubridate, and here packages into your session.
- 1b. Check your working directory.
- 1c. Read in all four raw data files associated with the EPA Air dataset, being sure to set string columns to be read in a factors. See the README file for the EPA air datasets for more information (especially if you have not worked with air quality data previously).
 - 2. Add the appropriate code to reveal the dimensions of the four datasets.

```

All four datasets should have the same number of columns but unique record counts (rows). Do your datasets follow this pattern?

#Answer: Yes, all four datasets have 20 columns but different observations.

Wrangle individual datasets to create processed files.

- 3. Change the Date columns to be date objects.
- 4. Select the following columns: Date, DAILY_AQI_VALUE, Site.Name, AQS_PARAMETER_DESC, COUNTY, SITE LATITUDE, SITE LONGITUDE
- 5. For the PM2.5 datasets, fill all cells in AQS_PARAMETER_DESC with "PM2.5" (all cells in this column should be identical).
- 6. Save all four processed datasets in the Processed folder. Use the same file names as the raw files but replace "raw" with "processed".

```
#3

EPAair.03.NC2018$Date <- as.Date(EPAair.03.NC2018$Date, format = "%m/%d/%Y") #Change vector type of col EPAair.03.NC2019$Date <- as.Date(EPAair.03.NC2019$Date, format = "%m/%d/%Y") #Change vector type of col EPAair.PM25.NC2018$Date, format = "%m/%d/%Y") #Change vector type of EPAair.PM25.NC2018$Date, format = "%m/%d/%Y") #Change vector type of EPAair.PM25.NC2019$Date, format = "%m/%d/%Y") #Change vector type of EPAair.PM25.NC2019$Date, format = "%m/%d/%Y") #Change vector type of #4

Q4.EPAair.03.NC2018 <- EPAair.03.NC2018 %>% select(Date, DAILY_AQI_VALUE, Site.Name, AQS_PARAMETER_DESC Q4.EPAair.03.NC2019 <- EPAair.03.NC2019 %>% select(Date, DAILY_AQI_VALUE, Site.Name, AQS_PARAMETER_DESC Q4.EPAair.PM25.NC2018 <- EPAair.PM25.NC2018 %>% select(Date, DAILY_AQI_VALUE, Site.Name, AQS_PARAMETER_DESC Q4.EPAair.PM25.NC2018 <- EPAair.PM25.NC2018 %>% select(Date, DAILY_AQI_VALUE, Site.Name, AQS_PARAMETER_DESC PAAIR.PM25.NC2018 %>% select(Date, DAILY_AQI_VALUE, SITE.NAMETER_DESC PAAIR.PM25.NC2018 %>% select(Date, DAILY_AQI_VALUE, SITE.NAMETER_DESC PAAIR.PM25.NC2018 %>% select(Date, DAILY_AQI_VALUE, SITE.NAMETER_DESC PAAIR.PM25.NC2018

```

Combine datasets

- 7. Combine the four datasets with rbind. Make sure your column names are identical prior to running this code.
- 8. Wrangle your new dataset with a pipe function (%>%) so that it fills the following conditions:
- Include only sites that the four data frames have in common:

```
"Linville Falls", "Durham Armory", "Leggett", "Hattie Avenue", "Clemmons Middle", "Mendenhall School", "Frying Pan Mountain", "West Johnston Co.", "Garinger High School", "Castle Hayne", "Pitt Agri. Center", "Bryson City", "Millbrook School"
```

(the function intersect can figure out common factor levels - but it will include sites with missing site information, which you don't want...)

- Some sites have multiple measurements per day. Use the split-apply-combine strategy to generate daily means: group by date, site name, AQS parameter, and county. Take the mean of the AQI value, latitude, and longitude.
- Add columns for "Month" and "Year" by parsing your "Date" column (hint: lubridate package)
- Hint: the dimensions of this dataset should be $14,752 \times 9$.
- 9. Spread your datasets such that AQI values for ozone and PM2.5 are in separate columns. Each location on a specific date should now occupy only one row.
- 10. Call up the dimensions of your new tidy dataset.
- 11. Save your processed dataset with the following file name: "EPAair_O3_PM25_NC1819_Processed.csv"

```
#7
Q7 <- rbind(Q4.EPAair.03.NC2018, Q4.EPAair.03.NC2019, Q5.EPAair.PM25.NC2018, Q5.EPAair.PM25.NC2019)
#Four datasets from Q4 and Q5 are merged by rbind. Rows are added to 37893, column number is same as 7.

#8
common_sites_03 <- intersect(Q4.EPAair.03.NC2018$Site.Name, Q4.EPAair.03.NC2019$Site.Name)
#common sites from 03 datasets.
common_sites_PM25 <- intersect(Q5.EPAair.PM25.NC2018$Site.Name, Q5.EPAair.PM25.NC2019$Site.Name)
#common sites from PM2.5 datasets.
```

```
common_sites <- intersect(common_sites_03, common_sites_PM25)</pre>
#common sites from all four datasets.
Q7$Site.Name[Q7$Site.Name == ""] <- NA #Change "" values in Site.Name column to NA.
Q8_v1 <- Q7 %>% filter(Site.Name %in% c(common_sites)) %>% drop_na(Site.Name) #Take only sites that are
Q8_v2 <- Q8_v1 %>%
  group by (Date, Site.Name, AQS PARAMETER DESC, COUNTY) %>%
   summarize(
         Mean_AQI = mean(DAILY_AQI_VALUE, na.rm = TRUE), #Take mean values for different observations.
         Mean_Latitude = mean(SITE_LATITUDE, na.rm = TRUE),
         Mean_Longitude = mean(SITE_LONGITUDE, na.rm = TRUE)
  )
## 'summarise()' has grouped output by 'Date', 'Site.Name', 'AQS_PARAMETER_DESC'.
## You can override using the '.groups' argument.
Q8_v3 <- Q8_v2 %>% mutate(Month = month(Date), Year = year(Date)) #Add year and month columns from "Dat
Q9 <- pivot_wider(Q8_v3, names_from = AQS_PARAMETER_DESC, values_from = Mean_AQI) #Create new columns a
dim(Q9) #8976 rows and 9 columns. Two columns disappeared and two new columns added in Question 9.
## [1] 8976
               9
write.csv(Q9, row.names = FALSE, file = "./Data/Processed/EPAair_03_PM25_NC1819_Processed.csv")
```

Generate summary tables

- 12. Use the split-apply-combine strategy to generate a summary data frame. Data should be grouped by site, month, and year. Generate the mean AQI values for ozone and PM2.5 for each group. Then, add a pipe to remove instances where mean **ozone** values are not available (use the function drop_na in your pipe). It's ok to have missing mean PM2.5 values in this result.
- 13. Call up the dimensions of the summary dataset.

[1] 239 5

14. Why did we use the function drop_na rather than na.omit? Hint: replace drop_na with na.omit in part 12 and observe what happens with the dimensions of the summary date frame.

Answer: drop_na() drops all NA values in the desired column as I used mean_Ozone_AQI here. But na.omit drops every NA values from other columns, so we have a 223x5 dataframe. This decrease in rows is because of 16 NA values in PM2.5 column.
